

Power LogOn[®] Mobile Extension

Making Passwords Secure

Description

Power LogOn Mobile extension allows customers to use their iPhones[®] and iPads[®] with iOS 12 to access their Power LogOn accounts. Power LogOn Mobile extension connects to the Power LogOn server hosted by the customer's own IT department. Power LogOn Mobile allows employees access to email, servers, and applications without typing or knowing any passwords that hackers can steal.

Power LogOn is a multi-factor enterprise authentication password manager allowing IT to centrally manage all their company's passwords.

Power LogOn removes the employee-managed password threat while enabling secure access to company computers, websites, servers, cloud and application without employees knowing, remembering, typing, generating or managing any more passwords. Power LogOn Mobile extends these features to Apple mobile devices.

What's the purpose of this app?

Power LogOn Mobile is an extension of our existing Power LogOn suite of products. Its purpose is to enable employees to access their company's Power LogOn password database using their mobile devices (iPhones and iPads).

How do users obtain an account

Customers who have purchased and installed Power LogOn can send a mobile enrollment invitation email to their employees.

This email includes app installation instructions and enrollment information, which includes the server URL and enrollment code. Enrollment also requires knowledge of the Power LogOn user PIN.

The PIN is used as a factor in Power LogOn's multi-factor authentication process.

Credential Convenience

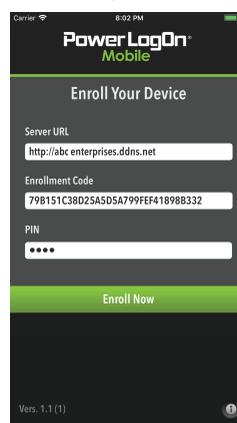

Combining multiple functions onto a single ID badge makes security management, loss discovery and plugging vulnerabilities fast and easy.

Allowing multiple devices to access the same security data makes it convenient for employees.

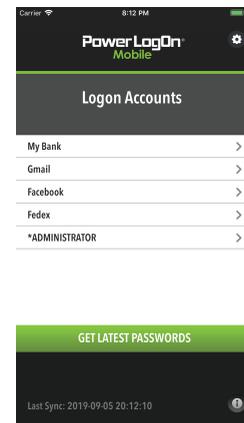

Allowing IT to maintain access privileges and passwords safeguard the company's network.

Expanding the role of the same license up to five different tokens makes Power LogOn affordable, flexible and manageable by IT.

Logon user names and passwords are stored and updated as before in the corporate Power LogOn installation. Automatically sync changes to the user's iPhone. Logon data is then filled into logon locations using the iPhone AutoFill feature.
