

We're taking on cybersecurity's biggest threat...

Employee-Managed Passwords

The Security Enforcer

Safeguarding my company's network against a data breach is my number one worry and responsibility. I know that employees are our weakest link in cybersecurity, so I need policies that don't allow them to circumvent my security. I respect government standards and specifications. My military background taught me the importance of having suppressive fire and defensive rings and that's how I protect our infrastructure.

The Networker

Without me and my beautiful network (aka Diana), nobody in this company would have a job. With great power comes great responsibility, so I take cybersecurity very seriously. There's no working architecture that's too dynamic or complex for me to handle. So, it's like my job is to keep Diana happy, healthy and safe. I control who accesses my network by protecting her with Multi-Factor Authentication that utilizes authentication, authorization and non-repudiation.

The Installer

You need new equipment? I'm your man. You want that new software application? Call me. If your request protects the data, lowers operating costs, and improves productivity, then I'm in. Because I'm so busy, I don't want to spend hours, let alone days, trying to get two pieces of software talking to each other. So, I identify vendors who use non-proprietary components that work seamlessly and don't lock me in to one vendor for life.

The Integrator

Convenience! I learned the hard way that security is not secure if it's not convenient. One of the best ways I add convenience is to integrate all security onto one credential. My holistic approach secures the gaps between different products, while leveraging existing infrastructure and preventing employees from circumventing security policies. That's why I demand that employee ID badges do more than just make a door go beep.

The_Fixer@access-smart.com

The Fixer

I'm the one who makes legacy systems work with new systems. While certificates may sound great, some older systems just can't handle them. Passwords are secure, it's how they're managed that's the problem. I also take all those damn helpdesk calls. I wish management knew how much company time and money is wasted because employees forget their passwords. I could save the company a ton of money and fix this problem with an enterprise password manager that includes MFA.

Password Concierge

I serve the Guardians of the Gateway here inside the virtual world of the Internet. Think of me as your personal cyber assistant. I help elite teams of IT professionals protect their company's computers, networks and data from cyberattacks.

Elite IT pros understand that data security is essential to their company's longevity. It's their job to keep customer's personal information secure and employees working. Cyber security is a team effort. Together we bring a holistic solution that combines all our skills, talents and responsibilities. Are you in?
